Blackout Comms Settings

Device

Device-level settings, relating to UI, time, etc.

Firmware Version	Firmware & encryption version
Sound Enabled	Play sound for new messages
Backlight Level	Screen backlight brightness
Firmware License	Device license type
Clear Messages	Delete stored messages
Message History	Whether to store messages to SD / Flash
Screen Timeout	Time until screen powers off
Daylight Savings	Whether to adjust for DST
Time Zone	Device time zone
Device ID	Unique hardware ID
Uptime	Minutes since reboot
Device Time	Current time
Factory Reset	Clear device storage & keys

Mesh

Settings relating to how this device performs meshing

Clear Cache	Delete all cached mesh packets
Mesh Syncing	Whether meshing is enabled
Mesh Reset	Clears mesh packets & ratings
Remote Control	Allow/disallow other devices to issue
Broadcast Time	Whether to broadcast time regularly, helping nearby devices startup faster

Security

Settings relating to trust and security

SD Portable	If enabled, your SD card can be moved to a different comm at any time, or whether the SD card should be locked to this device
Change Password	Set a new password on this device - the password can never be retrieved!
Truststore Lock	Whether to recognize or ignore new devices on this cluster
Key Forwarding	Whether to forward and/or trust other forwarded public keys from trusted devices
Ignore Expiry	Whether to receive expired messages

LoRa

Settings relating to trust and security

LoRa Enabled	Whether to enable LoRa, can only be disabled if MQTT or UDP is enabled

Mesh Cloud

MQTT related settings - WiFi & MQTT service are required

Cloud Setup	Setup MQTT server/authentication
MQTT Enabled	Enable/disable MQTT (WiFi is required)
Prefer Cloud	Route packets via MQTT when possible

Channel

Channels allow you to communicate via encrypted broadcasts + channel hopping, given a shared set of passwords

Change Channel	Change to a different configured open channel
New Channel	Configure a new open channel
Receive Channel	Receive config from another device that is broadcasting channel config
Delete Channel	Remove channel config from device

Cluster

A cluster is a group of 1-90 devices, that securely work together as a mesh network to share location, state, forward messages, and more

Ping Log	Display last 5 pings on home screen
Broadcast Time	Immediately broadcast time to help a nearby device startup
Broadcast Identity	Immediately broadcast public key
Your Address	Device's cluster-assigned address
Change Cluster	Switch device to a different cluster, if another is configured
Join Cluster	Connect with a root device to join its cluster
Onboard Device	Securely add a new device to this cluster, *only root can do this*
Add Anon Link	Add an anonymous link that can receive/ display/rebroadcast
Create Cluster	Create & become root of a new cluster
Delete Cluster	Delete a cluster configuration

Location

Whether to use GNSS/GPS, and related settings

GNSS Type	Onboard GNSS module and/or RTC
Location Sharing	Whether or not to share location
Clear Locations	Delete all device locations
Location Link	Whether location QR shows google maps link or embedded coordinates
Location Enabled	Enable/disable GNSS module
Use GPS	Whether to accept GPS satellite data
Use Glonass	Whether to accept Glonass data
Use BeiDou	Whether to accept BeiDou data

WiFi

Connects on 2.4 GHz & can run in parallel with LoRa

Add Network	Add up to 5 WiFi SSIDs / credentials
Delete Network	Delete a stored WiFi SSID
Current Network	Display currently-connected WiFi
Auto Reboot	If MQTT is enabled connectivity is lost for more than a few minutes, should this device reboot automatically
